SURE SUCCESS: SSLC - Social Science Module

SOCIAL SCIENCE – 1

1. Characteristics of the Renaissance Period

The changes that occurred in the social, cultural, economic, and political fields of Europe from the 14th century onwards are called the Renaissance.

Characteristics:

- Humanism
- Growth of cities
- Progress in trade
- Rational thinking
- Growth in art and science
- Individual freedom

2. Difference between Scholasticism and Humanism

Scholasticism:

- A philosophy based on the Christian religion.
- Gave importance to God and life in the hereafter.

Humanism:

- Gave importance to the present world and rational thinking.
- Emphasized human emotions, capabilities, writing, and speech.

3. Features of Renaissance Painting

- Realistic depiction of the human body.
- Use of oil colors.
- Portraits.
- Depiction of light and perspective (distance).

4. Reformation and Counter-Reformation

Reformation:

Reformation is the protest that emerged against specific tendencies and beliefs that existed in the Catholic Church.

Protested against the sale of "Indulgences" (Letters of Pardon).

Opposed the excessive power of priests and church courts.

Erasmus, John Wycliffe, and Martin Luther were the promoters of the Reformation movement.

Counter-Reformation:

The efforts by the Catholic Church to reform itself following the Reformation.

This self-reformation process is known as the Counter-Reformation.

A meeting of the church leadership was held at Trent in Italy.

Prohibited the sale of Indulgences and published an "Index" (of prohibited books).

Ignatius Loyola — Society of Jesus.

5. Causes of the French Revolution

Autocratic Rulers:

The rulers of the Bourbon dynasty in France were autocrats.

2025-26 GHS KURUKA

Louis XIV had declared, "I am the State."

The rulers were immersed in corruption, extravagance, and a luxurious lifestyle.

Social System:

French society was divided into three layers (Estates).

The First Estate consisted of the Clergy, the Second Estate of the Nobility, and the Third Estate of the common people.

People of the First and Second Estates were exempted from all taxes.

They received high positions and titles in the administration.

They possessed vast lands.

The majority of the people in the Third Estate, including workers, farmers, and the middle class, were in poverty.

Farmers received only a small portion of their crops.

They had to pay various taxes.

They also had to perform military service during times of necessity.

Dissatisfaction of the Middle Class:

Although the middle class, consisting of doctors, lawyers, and bankers, had advanced economically and educationally, they were not given the power or positions they deserved in the administration or military.

Economic Crisis:

Low production in the agricultural sector caused price hikes.

Due to the import of goods from abroad, French artisans faced a situation of job loss.

Influence of Ideas

The ideas of thinkers like Voltaire, Rousseau, Montesquieu, and John Locke inspired the people of France to lead a revolution against the government.

Meeting of the Estates General

After 175 years, when Louis XVI convened the Estates General (the Parliament of France), the people of the Third Estate demanded that instead of "one vote for one house," "one vote for every representative" should be given. The people of the First and Second Estates did not agree to this.

Tennis Court Oath

On June 17, 1789, the members of the Third Estate declared their assembly as the "French National Assembly." They gathered in a tennis court near the Parliament and declared that they would not disperse until a formal constitution was framed. This event is known as the Tennis Court Oath.

Start of the Revolution

When news spread that Louis XVI had dismissed his advisor Necker, the provoked crowd attacked the grain storehouses in Paris.

On July 14, 1789, they destroyed the Bastille Fort in Paris.

Fearing the anger of the people, Louis XVI gave recognition to the National Assembly.

7. Reforms implemented by the National Assembly

Prepared a separate constitution for the country.

2025-26 GHS KURUKA

Issued the Declaration of the Rights of Man, clarifying that all humans have equal rights.
Abolished slavery.
Canceled excessive taxes.
Issued a new currency called the "Assignat."
Confiscated the properties of religious leaders; priests became government-salaried employees.
Abolished the special privileges of the First and Second Estates.
Olympe de Gouges and Madame Jeanne Roland were strong female voices during the revolutionary period.
They advocated for a social structure where women and men have equal power and rights.

8. September Massacre

In 1792, the National Convention, which came into existence replacing the National Assembly, declared France a Republic.
Louis XVI was subjected to the death penalty.
Nobles, priests, and supporters of the King were branded as traitors and killed in mass.
A special machine called the "Guillotine" was used for this; this is known as the September Massacre.

9. Results of the French Revolution

- Feudalism in France was destroyed.
- Properties of the nobles were confiscated.
- The powers of the priests disappeared.
- A unified system of weights and measures was implemented.
- Ideas of modern nationalism, democracy, and sovereignty came into existence.

10. Napoleon's Administrative Reforms

Napoleon was the military leader who seized power by overthrowing the Directory, which existed according to the new constitution of France.

- Napoleon brought a special Code of Law (Napoleonic Code).
- Allowed freedom to all religious groups.
- Took steps to make education universal.
- Established government schools under the name "Lycée."
- Started the "University of France."
- Established the Bank of France.
- Reorganized the army into various battalions.

11. Mercantilism

The economic policy that gives importance to gaining gold and silver through trade is known as Mercantilism.
According to this, the collection of gold and silver possessed by a country determines its wealth.
The feature of this policy is that a country can preserve its wealth and earn maximum profit by reducing imports and increasing exports.

12. Industrial Revolution

The major changes that occurred in the field of production between 1780 and 1850 are called the Industrial Revolution.

2025-26 GHS KURUKA

- With the Industrial Revolution, more machines began to be used in the production sector.
- Iron and steel technology developed.
- Steam began to be used as a source of energy.
- Transportation facilities developed.
- Production shifted from cottages to factories.

13. Advantages of the Industrial Revolution

- Rise of factories.
- Increase in production.
- New job opportunities.
- Rise of cities.
- Improved living conditions.

14. Disadvantages/Drawbacks of the Industrial Revolution

- Exploitation of workers.
- Rise of slums.
- Crowded, unhygienic cities.
- Miserable life for workers.

15. Causes of World War I

- Rivalry between imperialist countries.
- Aggressive nationalism.
- Formation of military alliances.
- The assassination of Francis Ferdinand, the heir to the throne of Austria-Hungary.

16. Consequences of World War I

- Loss of life for millions of soldiers and civilians.
- Collapse of agricultural and industrial sectors.
- European dominance began to decline.
- Freedom struggles intensified in Asian and African countries.
- Formation of the League of Nations.
- Totalitarian rule in countries like Italy, Germany, and Spain.

17. Totalitarianism

Totalitarianism is the establishment of the state's power and control over all areas of life without respecting the privacy of citizens.

Characteristics:

- Opposition to democracy.
- Disagreement with socialism.
- Aggressive nationalism.
- Favorable policy toward war and violence.

Example 1: Fascism in Italy

Founded by Mussolini.

Formed an army called "Blackshirts."

Maintained enmity toward socialists, workers, and peasant movements.

2025-26 GHS KURUKA

Example 2: Nazism in Germany

Founded by Hitler.

Formed an army called "Brownshirts."

Had a secret police force called "Gestapo."

Enmity toward Communists, Socialists, and Jews.

18. Causes of World War II

- Treaty of Versailles.
- Failure of the League of Nations.
- Formation of military alliances.
- Policy of Appeasement.

19. Results of World War II

- Tens of millions of people were killed.
- Food shortages and epidemics.
- European dominance ended.
- The United Nations (UN) was formed.
- Totalitarianism ended.
- Colonies in Asia and Africa gained independence.
- America and the Soviet Union became the superpowers of the world.

20. Agencies that shape Public Opinion

- Family
- Educational institutions
- Peer groups
- Media
- Political parties and their activities
- Social institutions and organizations
- Opinion polls
- Art and literature

21. Factors that hinder/obstruct the formation of Public Opinion

- Illiteracy
- Poverty
- Corrupt practices in propaganda
- Election corruption
- Regionalism

22. Gandhiji's Early Struggles

Champaran Satyagraha (1917): Struggle conducted to solve the problems of Indigo farmers in the Champaran district of Bihar.

Ahmedabad Cotton Mill Strike (1918): This was a struggle conducted by cotton mill workers in Ahmedabad, Gujarat, demanding a wage hike.

Kheda Satyagraha (1918): Struggle conducted by farmers in Kheda, Gujarat, demanding tax relief when crops were destroyed due to natural calamities.

23. Methods of Gandhiji's Non-Cooperation Movement

2025-26 GHS KURUKA

- Return the titles given by the British government.
- Resign from government jobs.
- Lawyers should boycott courts.
- Students should boycott British schools.
- Boycott foreign goods.

Participation of people in the Non-Cooperation Movement:

- Women began to collect and burn foreign clothing after boycotting it.
- Cotton mill workers in Madras and laborers in Assam went on strike.
- Railway workers in Bengal and students boycotted government colleges and schools.
- National schools were formed in India (e.g., Kashi Vidyapeeth in Banaras, Gujarat Vidyapeeth, Jamia Millia Islamia in Aligarh).
- People participated in the struggle by violating tribal forest laws.
- Farmers also participated; farmers in Bengal decided to boycott jute cultivation and instead grow paddy and cotton.
- Kisan Sabhas were formed in Awadh.

24. Gandhiji's Civil Disobedience Movement

Following the Lahore session of the Congress in 1929, a mass movement was started with the aim of attaining complete independence (Purna Swaraj).

Gandhiji started a new method of struggle by combining civil disobedience with non-cooperation.

The struggle was launched by violating the Salt Law at Dandi beach in Gujarat.

Participation of people in the struggle:

- Farmers did not pay tax to the government or rent to the landlords.
- Tribal people entered forests to collect resources by violating forest laws.
- Women participated in salt making and in picketing shops selling foreign goods.
- Workers participated by not attending work in railways, ports, and mines.
- Merchants were not ready to buy or sell imported products.

25. Basic Principles of India's Foreign Policy

* Peaceful co-existence.
* Opposing colonialism and racism (Apartheid).
* Protecting national security and sovereignty.
* Non-alignment policy.
* Panchsheel principles.

26. Challenges faced by Indian Democracy

- Communalism
- Secessionist movements
- Conflict in center-state relations
- Corruption
- Criminalism in politics
- Defection

2025-26 GHS KURUKA

27. National Integration — Characteristics

National integration is the process of bringing together people following different backgrounds, regions, languages, religions, and cultures into a unified and harmonious nation, while respecting these diversities.

Characteristics:

* Fosters Unity in Diversity.
* Promotes harmony in society.
* Promotes social development.
* Strengthens the democratic system of governance.

2025-26 GHS KURUKA

SOCIAL SCIENCE - 2

1. Insolation: Insolation is the amount of solar radiation reaching the Earth's surface.

2. Radiation: The Earth's surface gets heated through solar radiation; subsequently, energy is re-radiated from the Earth's surface into the atmosphere as long waves. This is known as terrestrial radiation.

3. Heat Budget: The heat budget is the process of heat balance that maintains the temperature of the Earth's surface without increasing or decreasing, by re-radiating all the energy received from the sun back into the atmosphere.

4. Difference between Diurnal Range of Temperature and Daily Mean Temperature

- The difference between the maximum and minimum temperature of a day is the Diurnal Range of Temperature.
- The average temperature of a day is the Daily Mean Temperature.

5. Atmospheric Heat Transfer Processes

Terrestrial Radiation: The process by which the Earth's surface, heated by solar radiation, emits that heat as long waves.

Conduction: The process by which the lower layer of the atmosphere gets heated due to radiation.

Convection: The process where air near the Earth, after being heated, rises and spreads the heat upwards.

Advection: The process of heat spreading horizontally according to the wind.

6. Factors influencing Temperature Distribution

The same temperature is not experienced everywhere and at all times on Earth. Temperature changes according to spatial and temporal differences. Factors causing this:

* Latitudinal position of a region.
* Height from sea level (altitude).
* Differential heating of land and sea.
* Distance from the sea.
* Ocean currents.
* Physiography (terrain).

7. Atmospheric Pressure

Atmospheric pressure is the weight exerted by atmospheric air on the Earth's surface.

Factors influencing Atmospheric Pressure:

- Temperature
- Altitude
- Humidity

8. Global Pressure Belts

Pressure belts are formed centered on specific latitudinal regions on the Earth's surface. These are called global pressure belts.

Equatorial Low Pressure Belt: Pressure decreases here because the air in the equatorial region gets heated more, expands, and rises.

Subtropical High Pressure Belts: These are pressure belts formed in the 30-degree latitudinal regions in both hemispheres. This high-pressure belt is formed because the air that rose from the equatorial region gradually cools and descends in this area.

Subpolar Low Pressure Belts: This is an area found in the 60-degree latitudinal regions in both hemispheres. As a result of Earth's rotation, air in this region is thrown upward toward the sky on a large scale, causing pressure to decrease and making it a low-pressure area.

Polar High Pressure Belts: Since the process of air cooling, contracting, and descending occurs in the polar regions, the two polar regions centered around 90 degrees became high-pressure belts.

9. Main factor influencing Wind Direction:

Coriolis Force.

1**0. Factors influencing Wind Speed and Strength:**

Pressure Gradient Force, Frictional Force.

11. Planetary Winds

These are winds that blow constantly in a definite direction throughout the year. They are also known as Permanent Winds or Global Winds.

Trade Winds: Blow from Subtropical High Pressure Belts toward the Equatorial Low Pressure Belt.

Westerlies: Blow from Subtropical High Pressure Belts toward the Subpolar Low Pressure Belts.

Polar Easterlies: Blow from Polar High Pressure Belts toward the Subpolar Low Pressure Belts.

12. Cyclones and Anti-cyclones (These are unstable/variable winds)

Cyclone: Wind blowing toward a center of low pressure from surrounding areas of high pressure.

Anti-cyclone: Wind blowing from a center of high pressure toward its surrounding areas of low pressure.

- In the Northern Hemisphere, cyclones move in an anti-clockwise direction.
- In the Northern Hemisphere, anti-cyclones move in a clockwise direction.

13. Various Forms of Condensation:

2025-26 GHS KURUKA

Dew, Frost, Mist/Fog, Clouds.

14. Various Types of Clouds

Cirrus Clouds: Seen as similar to feather tufts in the high levels of the atmosphere.

Stratus Clouds: Clouds that form as thick layers in the lower levels of the atmosphere.

Cumulus Clouds: Clouds similar to cotton tufts formed as a result of convection currents.

Nimbus Clouds: These are dark rain clouds in the lower levels.

15. Various Forms of Precipitation:

Rain, Snowfall, Hailstones.

16. Various Types of Rain:

- **Orographic Rainfall:** Rain formed on the windward side of a mountain when moisture-laden air coming from the sea hits the slopes of the mountain and rises.
- **Convectional Rainfall:** This is rain caused by the convection process during the summer.
- **Cyclonic Rainfall:** Rain caused by the meeting of warm air and cold air within a cyclonic system.

17. What is Money?

Generally, anything that is accepted for the exchange of goods and services is called money.

18. General Functions of Money:

Medium of exchange, measure of value, store of value, standard for deferred payments (future transactions).

19. Functions of the Reserve Bank

Established on April 1, 1935, in Kolkata.

Prints Currency: Except for the one-rupee note and coins, all currencies are printed and issued by the Reserve Bank. (The Ministry of Finance, India, prints coins and the one-rupee note).

Bankers' Bank: Acts as the bank for all banks by providing loans to banks and helping to settle transactions between banks.

Regulates the quantity and credit of money: Controls the price level of goods and services to prevent inflation.

Acts as Government's Bank: The Reserve Bank of India maintains government accounts and provides banking services. It also gives necessary advice to the government on monetary policy and fiscal policy.

Changes Cash Reserve Ratio: This is done by changing the amount of money that banks must keep as a reserve in the Reserve Bank from the deposits they receive.

Custody of foreign exchange reserves.

- Publication of reports.
- Repo Rate and Reverse Repo Rate:
- Repo Rate is the interest created when commercial banks take loans from the Reserve Bank.
- Reverse Repo Rate is the interest given to the money that commercial banks deposit in the Reserve Bank.

2025-26 GHS KURUKA

20. Commercial Banks

These are banks with permission from the RBI to provide banking services.

Functions of Commercial Banks:

Accepting Deposits: Savings deposit, Current deposit, Fixed deposit, Recurring deposit.

Providing Loans: Provides loans to individuals and institutions for different economic activities; interest is charged for various loans. Loans are provided by accepting various securities like land documents, gold, salary certificates, etc.

Other Functions: Credit card, Debit card, ATM facility, Locker services.

21. Banking Technologies:

NEFT, RTGS, CORE BANKING, UPI.

22. Non-Banking Financial Institutions:

Insurance companies (e.g., LIC), Mutual Funds (e.g., UTI), Non-Banking Financial Companies (KSFE) are all non-banking institutions.

23. 'Financial Inclusion'

Financial inclusion refers to the steps taken by the country to bring the benefits of money and the activities of financial institutions to everyone.

Steps taken by the government for financial inclusion:

Bank Nationalization: To develop banking in the rural sector and provide loans at low rates, 14 banks were nationalized in 1969 and 6 banks in 1980.

Cooperative Bank System: Cooperative banks were formed to activate the rural economy. Principles like cooperation, self-help, and mutual help are behind this.

Microfinance: Microfinance aims to provide services to low-income individuals, families, and businesspeople who do not have access to banking services. Its goals include reducing poverty, empowering women, encouraging entrepreneurs, ensuring employment, and improving living standards (Example: Kudumbashree).

Jan Dhan Account: The Pradhan Mantri Jan Dhan Account is a project for everyone in the country who does not have a bank account to start one.

24. Earth Movement:

The movements responsible for the rise and fall of the Earth's surface are called Earth movements.

25. Endogenic Movements: Movements operating at different intensities within the Earth.

Forces causing them:

Primordial heat, Rotation, Convection current, Thermal variation.

26. Exogenic Movements: Movements operating at different intensities on the Earth's surface.

Forces causing them:

Slope of the terrain, Gravitational force, Flowing water, Glacier, Groundwater, Waves.

27. Rapid Movements: Earthquakes, Volcanic activities.

28. Slow Movements: Continent-forming processes, Mountain-forming processes.

29. Volcanic Activity

2025-26 GHS KURUKA

- The asthenosphere is the liquid layer below the lithosphere (which consists of the Earth's outermost layer, the crust, and the upper part of the mantle).
- The process of rock melt or "magma" flowing to the Earth's surface through cracks and weak parts of the lithosphere is called volcanic activity.
- Along with the rock melt, gases, ash, rock fragments, dust, and water vapor are also expelled. These materials are called volcanic materials.

30. How does Volcanic Activity influence human life?

- Volcanic eruptions cause damage to life and property.
- Economic activities and public life get disrupted.
- Lava floods affect habitats, homes are destroyed, and people become unemployed.
- Although volcanic activities are dangerous to humans, they can also be beneficial:
- Ash from volcanoes and soil formed by the weathering of rocks formed when lava cools and solidifies are very fertile.
- Many valuable minerals reach the Earth's surface through lava flows (magma that reaches the Earth's surface is called lava).
  Geothermal energy emitted from volcanic regions can be converted into electrical energy.
- Volcanic regions attract tourists.

31. Earthquakes

- The lithosphere (crust and upper mantle), the outer layer of the Earth, exists as various plates.
- They slide over the liquid layer called the asthenosphere just below them.
- When movement occurs between two plates, friction will form at the boundaries.
- This friction obstructs the movement of the plates.
- Subsequently, high pressure is created at the boundaries of the plates, and energy is stored on a large scale.
- Following the pressure for the plates to move, due to sudden movement, the stored energy is released. This spreading to the Earth's surface in the form of waves is what turns into an earthquake.
- The center where energy is released is the **Focus.**
- The center on the Earth's surface closest to the focus is the **Epicenter.**

32. Weathering

The process where rocks are physically disintegrated or chemically decomposed as a result of various exogenic processes is called weathering.

Physical Weathering: When rocks contract and expand due to temperature differences, it causes rocks to disintegrate. Water freezing in the cracks of rocks causes the cracks to expand, leading to the splitting of rocks.

Chemical Weathering: Rocks decompose as a result of minerals in the rocks engaging in chemical reactions with oxygen, carbon dioxide, and water through rainwater.

2025-26 GHS KURUKA

Biological Weathering: Rocks disintegrate when plant roots penetrate into the cracks of rocks and when small organisms make burrows. Rocks also fragment during the decay process of plant and animal remains.

Human Activities: Mining, quarrying, grazing animals.

How Weathering processes are beneficial to humans:

- Weathering leads to soil formation.
- Minerals in rocks get separated, leading to mineral enrichment.
- Helps in mining activities.

33. Mass Wasting

Mass wasting is the process where rock fragments or earth materials fall down a sloped surface due to the influence of gravitational force.

Examples: Landslides, rockfalls, creeping of hills, debris flow, sinking of earth.

Debris Flow: The phenomenon where rock and soil fall rapidly down a hillside along with water flow.

Creeping of Hill: Parts of the hill sliding down due to gravitational force. Both of these together are called landslides (Uruulpottal).

Causes:

Extreme rain, cloudburst, earthquake, unscientific quarrying, unscientific construction activities.

34. Per Capita Income

Per capita income is an important index used to calculate and evaluate the economic growth of a country.

Based on per capita income, economies are classified into four categories: Low income, Lower-middle income, Upper-middle income, High income.

35. Drawbacks of Per Capita Income

* It is an average income.
* It does not show information regarding the distribution of wealth and inequality.
* Since it depends on national income, limitations in calculating national income are included in this as well.
* Factors increasing the quality of life do not come within its scope.

36. Human Development Index — HDI

This is an index for measuring the economic development of a country. HDI is prepared by calculating the separate values of life expectancy, literacy, enrollment rate, and per capita income.

37. Physical Quality of Life Index — PQLI

The Physical Quality of Life Index is the average of basic literacy, infant mortality rate, and life expectancy figures.

38. Renewable Resources

- These are produced continuously in nature through physical or chemical processes. They do not get exhausted after use.

2025-26 GHS KURUKA

- They can be used again and are available in abundance.
- Examples: Solar energy, wind, waves.

39. Non-Renewable Resources

- Formed in nature over millions of years.
- These are resources whose quantity decreases according to use.
- Examples: Coal, petroleum, natural gases.

40. Sustainable Development

- Natural resources must be used carefully.
- Natural resources must be utilized in a way that does not harm the ecosystem and does not affect the climate.
- Over-utilization should be reduced as much as possible.
- Sustainable development is development that meets our present needs in a way that can be fulfilled without creating obstacles to the ability of future generations to fulfill their needs

2025-26 GHS KURUKA
