(i) Median daily wage = Daily wage of the 22nd worker $= x_{22}$ 1

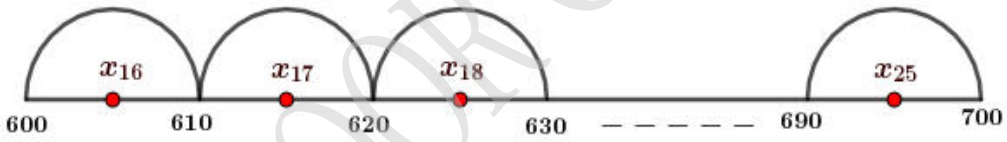

Median class = 600 − 700

There are 10 workers in the median class 1

Divide the 100 rupees between 600 and 700 into 10 equal parts .

Length of one sub division $= \frac{100}{10} = 10 = d$ 1

Assume that each such subdivision contains one worker whose daily wage is the mid value of that subdivision . .

(ii) Daily wage of the 16th worker $= x_{16} = \frac{600 + 610}{2} = 605\ Rs$ 1

The daily wages in the median class are in arithmetic sequence

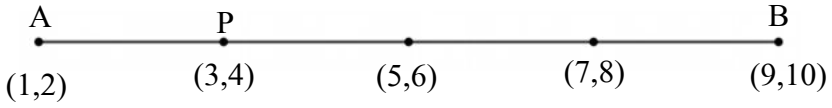

(iii) Median daily wage $= x_{22} = 605 + (6 \times 10) = 665\ Rs$ 1
